The conjectured QCD Phase Diagram

QCD: two phase transitions:

restoration of chiral symmetry $SU_{L+R}(N_f) \rightarrow SU_L(N_f) \times SU_R(N_f)$

order parameter:

$$\langle \bar{q}q \rangle \left\{ \begin{array}{l} > 0 \Leftrightarrow {
m symmetry broken, } T < T_c \\ = 0 \Leftrightarrow {
m symmetric phase, } T > T_c \end{array}
ight.$$

associate limit: $m_q \rightarrow 0$

chiral transition: spontaneous restoration of global $SU_L(N_f) \times SU_R(N_f)$ at high T

The conjectured QCD Phase Diagram

free energy of static quark antiquark pair:

$$\exp\left(-\frac{F_{\bar{q}q}(r,T)}{T}\right) = \langle \mathrm{tr}_{c}\mathcal{P}(x)\mathrm{tr}_{c}\mathcal{P}^{\dagger}(y)\rangle/N_{c}^{2}$$

Functional RG Approach

 $\Gamma_k[\phi]$ scale dependent effective action ; $t = \ln(k/\Lambda)$; R_k regulators

FRG (average effective action)[Wetterich]
$$\partial_t \Gamma_k[\phi] = \frac{1}{2} \operatorname{Tr} \partial_t R_k \left(\frac{1}{\Gamma_k^{(2)} + R_k} \right)$$
; $\Gamma_k^{(2)} = \frac{\delta^2 \Gamma_k}{\delta \phi \delta \phi}$

RG analysis

• Ansatz for Γ_k :

$$\begin{split} \Gamma_k &= \int d^4 x \bar{q} [i \gamma_\mu \partial^\mu - g (\sigma + i \vec{\tau} \vec{\pi} \gamma_5)] q + \frac{1}{2} (\partial_\mu \sigma)^2 + \frac{1}{2} (\partial_\mu \vec{\pi})^2 + V_k (\phi^2) \\ V_{k=\Lambda} (\phi^2) &= \frac{\lambda}{4} (\sigma^2 + \vec{\pi}^2 - v^2)^2 - c \sigma \end{split}$$

RG analysis

• Ansatz for Γ_k :

$$\Gamma_k = \int d^4 x \bar{q} [i \gamma_\mu \partial^\mu - g(\sigma + i \vec{\tau} \vec{\pi} \gamma_5)] q + \frac{1}{2} (\partial_\mu \sigma)^2 + \frac{1}{2} (\partial_\mu \vec{\pi})^2 + V_k(\phi^2)$$

flow for grand canonical potential

[BJS, J.Wambach]

$$\partial_t \Omega_k(T,\mu;\phi) = \frac{k^4}{12\pi^2} \left[\frac{3}{E_\pi} \coth\left(\frac{E_\pi}{2T}\right) + \frac{1}{E_\sigma} \coth\left(\frac{E_\sigma}{2T}\right) - \frac{2N_c N_f}{E_q} \left\{ \tanh\left(\frac{E_q - \mu}{2T}\right) + \tanh\left(\frac{E_q + \mu}{2T}\right) \right\} \right]$$
$$E_\pi^2 = 1 + 2\Omega'_k/k^2 , \qquad E_\sigma^2 = 1 + 2\Omega'_k/k^2 + 4\phi^2 \Omega''_k/k^2 , \qquad E_q^2 = 1 + g^2 \phi^2/k^2$$
$$\phi \sim \langle \bar{q}q \rangle , \qquad \Omega'_k = \partial \Omega_k/\partial \phi \quad \text{etc}$$

Quark-meson model study for $N_F = 2$

Mean field versus RG

Influence of fluctuations on phase diagram

Findings:

- ▷ MF phase diagram: no TCP (in chiral limit) found
- ▷ RG phase diagram: two TCP's (in chiral limit) & CEP found
- ▷ Size of critical region via susceptibilities: "compressed" with fluctuations

Quark-meson model study for $N_F = 3$

Summary

Polyakov–quark-meson model study for $N_F = 2$

only mean-field approximation

Findings:

▷ Parameter in Polyakov loop potential: $T_0 \Rightarrow T_0(N_f, \mu)$

pure gauge: $T_0 \sim 270 \text{ MeV}$ $N_f = 2$: $T_0 \sim 210 \text{ MeV}$

- Chiral & deconfinement transition coincide
- Mean-field approximation encouraging

Quark-meson model is renormalizable

 \rightarrow no UV cutoff parameter (cf. PNJL model)

Outlook

- include quark-meson dynamics in PQM model with RG
